## 1.0

# Introduction

Dillon Consulting Limited (Dillon) was retained by Tri-M Holdings Corp. to prepare a stormwater management strategy in support of Detailed Design for the proposed development at 440 Texas Road in the town of Amherstburg, Ontario. As shown on Figure 1, the proposed development land is located on the north side of the Texas Road; west of Concession Road 2 N in the town of Amherstburg.

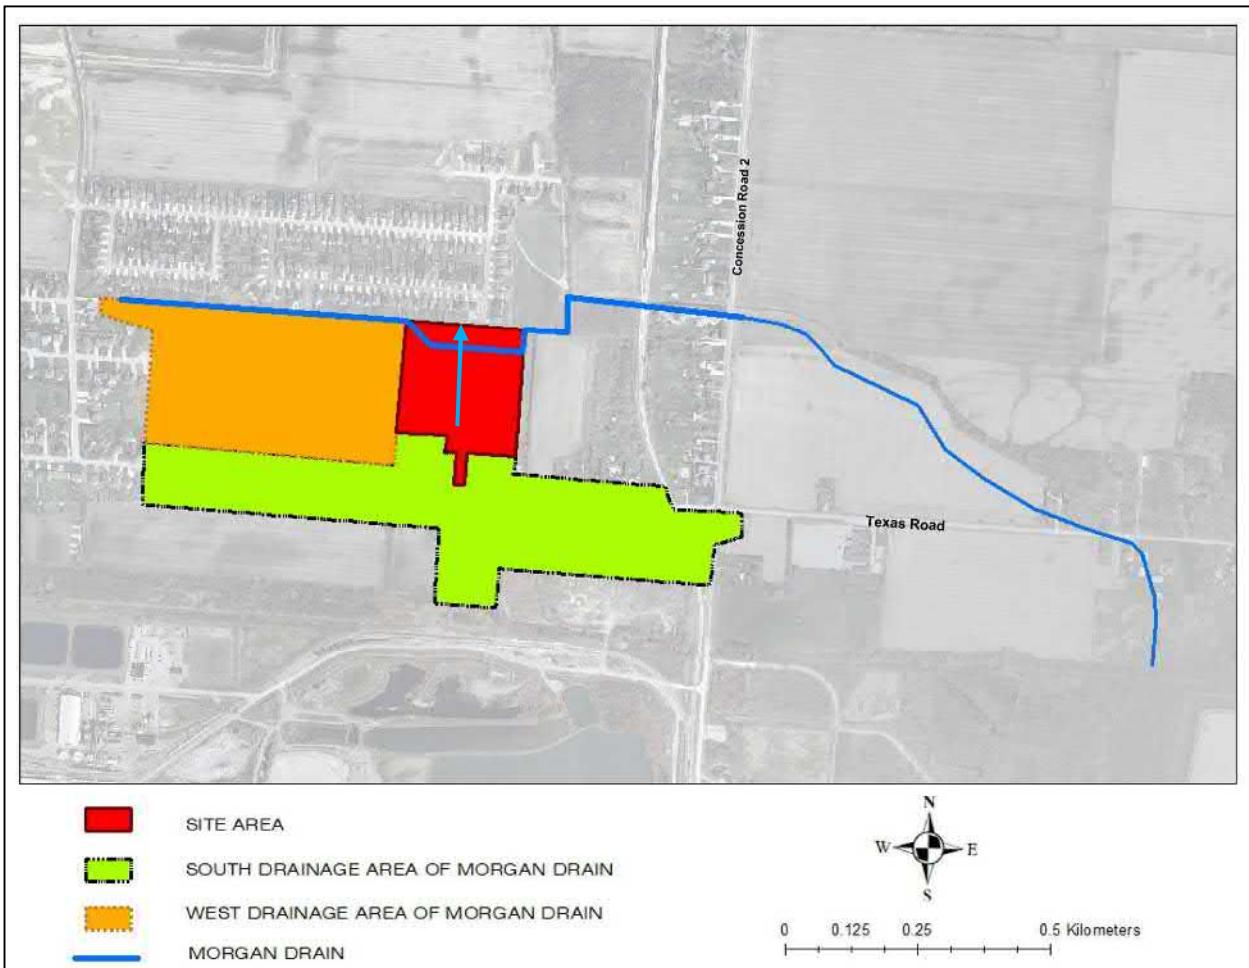

Figure 1: Project Site Location

The existing site is approximately 5.3 ha (13.1 ac) in size, and consists primarily of undeveloped land. Under the proposed development conditions, the site will consist of 48 proposed single residential lots, one stormwater management (SWM) pond, proposed right of way (ROW), and a 0.07 ha area dedicated as future development which will likely be developed into a park.

It should be noted that a branch of the Morgan Drain runs through this site area. Under the proposed conditions, the west and south branches of the Morgan Drain will tie into the site storm sewers, which will outlet to the proposed stormwater management pond. A portion of the site storm sewers will

legally be part of the Morgan Drain, as well as the stormwater management pond. The west and south drain branches have external contributing areas of 13.22 ha and 12.20 ha respectively, for a total of 25.42 ha (62.81 ac). The layout of the Morgan drain and north-west and south drainage areas are shown in Figure 1 and the 440 Texas Road site plan is shown in Appendix A.

1.1

## Background Information

The following items were reviewed and inform the currently analysis:

- Stormwater Management Planning and Design Manual (Ministry of the Environment (MOE, 2003);
- Highway Drainage Design Standards (Ontario Ministry of Transportation, January, 2008) (HDDS, MTO, 2008);
- Hydraulic Design of Energy Dissipators and Culverts for Channels, Hydraulic Engineering Circular No. 14, Third Edition (U.S. Department of Transportation, July 2006) (HEC 14, 2006);
- Material Specification for Aggregates (Ontario Provincial Standard Specification, November, 2013) (OPSS, MUNI, 2013);
- 440 Texas Road Site Plan (Provided in Appendix A);
- Windsor/Essex Region Stormwater Management Standards Manual (ERCA SWM Standards, 2018); and
- Morgan Drain Plan, Town of Amherstburg, R Dobbin Engineering Inc.

1.2

## Stormwater Management Design Criteria

The stormwater management (SWM) design criteria were developed based on the guidance presented in the ERCA SWM Standards, 2018 and Stormwater Management Planning and Design Manual (Ministry of the Environment (MOE, 2003).

1.2.1

### Minor System Conveyance

Proposed site storm sewers are required to convey the 1:5 year design storm event and maintain a hydraulic grade line (HGL) at least 300 mm below ground surface.

1.2.2

### Major System Conveyance

For return period storm events in excess of the 1:5 year, up to and including the 1:100 year event, the maximum allowable surface ponding depth is 300 mm.

1.2.3

### Quality Control

Runoff produced by the site is required to be treated to a "Normal" protection level, which is defined by the removal of 70% of total suspended solids (TSS) on an average annual basis.

<p><b>1.2.4</b></p>	<p><b>Quantity Control</b></p> <p>The allowable release rate from this development will be the existing conditions 1:2 year peak runoff rate. All storms up to and including the 1:100 year event will be required to be controlled to this allowable rate.</p>
<p><b>1.2.5</b></p>	<p><b>Climate Change Resiliency Assessment</b></p> <p>The Urban Stress Test (UST) design storm event, as identified within the Windsor/Essex Region Stormwater Management Standards Manual (December, 2018), will be used to evaluate the resiliency to the potential impacts of climate change of the proposed development. For events up to and including the Urban Stress Test (UST) event, runoff is not to spill overland off the site.</p>
<p><b>1.2.6</b></p>	<p><b>Design Storms</b></p> <p>The following design storm events were used for the analysis:</p> <ul style="list-style-type: none"> <li>● 1:100 year, 4 hour design storm using Chicago distribution with 15 minute time interval with a total rainfall depth of 81.6 mm.</li> <li>● 1:100 year, 24 hour design storm using SCS Type-II distribution with a 2 hour time interval and a total rainfall depth of 108 mm.</li> <li>● Urban Stress Test (UST) Storm - 1:100 year, 24 hour design storm using Chicago distribution with 15 minute time interval and an additional 42 mm uniformly distributed, with a total rainfall depth of 150 mm.</li> <li>● Water Quality Storm - 1:2 year, 4 hour design storm using Chicago distribution with a 15 minute time interval and a total rainfall depth of 32 m.</li> </ul>
<p><b>1.3</b></p>	<h2>Modelling Approach</h2> <p>Assessment of hydrologic and hydraulic conditions for both existing and proposed scenarios was undertaken using the PCSWMM 2021 software distributed by CHI. PCSWMM is a modelling software for stormwater, wastewater, and watershed systems which provides a graphic user interface (GUI) for the United States Environment Protection Agency's Stormwater Management Model (EPA SWMM).</p> <p>The stormwater assessment for this development was completed using the Green-Ampt infiltration method for the hydrologic calculations and the dynamic wave routing method for the hydraulic calculations.</p> <p>Development of the existing and proposed conditions models are summarized in subsequent sections.</p>

2.0

## Existing Conditions

Under existing conditions, the 5.3 ha site consists of undeveloped agricultural land. The site is generally flat with a gentle slope towards the existing Morgan Drain.

2.1

### Site Soil

Based on the ERCA soil mapping data, the soil characteristics for the 440 Texas Road site area is composed of Brookston Clay which has a hydrologic soil group (HSG) D classification (Table A-3.7.7, ERCA SWM Manual, 2008). The infiltration parameters for the existing condition model has been selected based on this soil type.

2.2

### Existing Conditions Hydrologic Assessment

The existing conditions sub-catchment parameters used in the PCSWMM model are provided below in Table 1. Infiltration parameters were selected using the ERCA SWM Manual (Table - 3.7.7.3, ERCA SWM Manual, 2008) based on the hydrologic soil group classification. As the existing area is primarily undeveloped - with the exception of an existing residential property - the percent imperviousness has been selected as 5%. The typical Manning's roughness coefficients are selected from the ERCA SWM Manual (Table – 3.7.4.1, ERCA SWM Manual, 2008). Full details of all the input parameters provided in the existing conditions PCSWMM model are provided in the model output found in Appendix B.

**Table 1: Existing Condition Sub-Catchment Parameters**

Attribute	Development
Land Use	Agricultural
Area (ha)	5.3
Flow Length* (m)	380
Imperviousness (%)	5
Slope (%)	0.5
Manning's n Impervious	0.013
Manning's n Pervious	0.15
Depression Storage Impervious (mm)	2.5
Depression Storage Pervious (mm)	7.5
Infiltration: Suction Head (mm)	180
Infiltration: Conductivity (mm/hr)	0.5
Infiltration: Initial Deficit (fraction)	0.1

\*Maximum flow path to outlet

**2.2.1****Morgan Drain Sub-Catchment Areas**

Subcatchment attributes for the Morgan Drain drainage areas were provided by the Drainage Engineer as a drainage report is under production concurrently. Composite runoff coefficients were provided as part of the subcatchment properties, which were converted to per cent imperviousness to use in PCSWMM. These subcatchment parameters are summarized in Table 2 below.

Table 2: Post Development Sub-Catchment Parameters for the Morgan Drain Drainage Areas

Attribute	Development	
	West Drainage Area	South Drainage Area
Land Use	Agricultural	Agricultural/Residential
Area (ha)	13.22	12.20
Flow Length* (m)	236	650
Imperviousness (%)	3	33
Slope (%)	0.1	0.1
Manning's n Impervious	0.013	0.013
Manning's n Pervious	0.15	0.15
Depression Storage Impervious (mm)	2.5	2.5
Depression Storage Pervious (mm)	7.5	7.5
Infiltration: Suction Head (mm)	180	180
Infiltration: Conductivity (mm/hr)	0.5	0.5
Infiltration: Initial Deficit (fraction)	0.1	0.1

\*Maximum flow path to outlet

The north-west and south subcatchments of the Morgan Drain were connected through a dummy subcatchment in the PCSWMM model to provide a total peak flow rate from external areas while accounting for peak timing.

**2.3****Allowable Release Rate**

As discussed in Section 1.2.4, the allowable release rate has been selected as the existing conditions 1:2 year storm event for the 5.3 ha of site area. The peak runoff rate during the 1:2 year Chicago 4 hour storm event was estimated using the PCSWMM model as 0.102 m<sup>3</sup>/s. Modelling results are included in Appendix B.

3.0

# Proposed Conditions

3.1

## Proposed Conditions Hydrologic Analysis

Under proposed conditions, the 5.3 ha site area consists of 48 proposed single family residential lots, road ROW, a SWM pond, and a future development area. As the level of imperviousness is proposed to be higher compared to existing conditions, a stormwater management pond will be required to achieve the target release rate noted in Section 2.3. The external contributing areas of the Morgan Drain tie into the storm system at the north-west corner of the site, and south boundary as shown in Appendix A. These subcatchments are included in the PCSWMM model, and flow is conveyed into the proposed SWM pond. Twin bypass pipes are proposed to allow external flows to outlet the proposed wet pond with a maximum outflow rate of the external area inflow. These bypass pipes will be set with an invert (181.70 m) above the normal water level (181.2 m) in order to drain the external flows via gravity to the Morgan Drain north of the site. Once water levels in the pond drain below the bypass pipe inverts, a pump is proposed to lower the remaining volume to the normal water level of the permanent pool. The pump outlet rate will be proportional to the total developed area of the Morgan Drain catchment to this point, and is established in Section 3.2.3 of this report.

Sub catchment attributes for the proposed development were selected based on the ERCA SWM standard and are summarized in Table 3 below. Note that a portion of the site includes a 0.07 ha "future development" area which is anticipated to consist largely of green space, and has been assumed as 20% impervious for this analysis. Additional details of the modelling parameters and other model details for proposed conditions are provided in Appendix C.

Table 3: Post Development Sub-Catchment Parameters for the Site

Attribute	Development
Land Use	Residential
Area (ha)	5.3
Flow Length* (m)	345
Imperviousness (%)	62
Slope (%)	1
Manning's n Impervious	0.013
Manning's n Pervious	0.15
Depression Storage Impervious (mm)	2.5
Depression Storage Pervious (mm)	7.5
Infiltration: Suction Head (mm)	180

Attribute	Development
Infiltration: Conductivity (mm/hr)	0.5
Infiltration: Initial Deficit (fraction)	0.1

\*Maximum flow path to outlet

The stormwater management (SWM) facility will be located near the east area of the subdivision development. The facility will occupy approximately 0.55 ha of the development site. The proposed SWM facility has been sized with 3:1 side slopes in the active storage area and 5:1 side slopes in the permanent pool. The proposed pond has a total depth of 3.0 m with 2.0 m of active storage and 1.0 m of permanent pool depth.

The proposed wet pond will include twin bypass pipes for larger storm events to allow the external Morgan Drain flows to be conveyed unimpeded by the pond outlet structure. The bypass pipes are proposed as 1.092 m by 1.727 m horizontal elliptical pipes. The bypass has been sized such that the outflow is equal to or less than the peak inflow from the external subcatchments under the 1:5 year, 1:100 year, and UST events.

### 3.1.1 Tailwater Conditions

To account for tailwater conditions in the Morgan Drain downstream of the site, flows from the North Branch have been included in the model. The sub-catchment parameters considered for the North Branch contributing area are provided in Table 4 below.

Table 4: Sub-Catchment Parameters for the Morgan Drain North Branch Drainage Area

Attribute	Development
Land Use	Residential/Undeveloped
Area (ha)	53
Flow Length (m)	1450
Imperviousness (%)	40
Slope (%)	0.1
Manning's n Impervious	0.013
Manning's n Pervious	0.15
Depression Storage Impervious (mm)	2.5
Depression Storage Pervious (mm)	7.5
Infiltration: Suction Head (mm)	180
Infiltration: Conductivity (mm/hr)	0.5
Infiltration: Initial Deficit (fraction)	0.1

Additional details of the modelling parameters and the sub-catchment layout are provided in Appendix C.

## 3.2 Stormwater Management Measures

The proposed stormwater management strategy consists of a wet pond to provide quality and quantity control. The outlet of the proposed pond will consist of two elements – a low flow pump and a high flow bypass system. As a portion of the active storage within the pond is at a lower elevation than the receiving system, the pump will be active while water levels in the pond are between the permanent pool elevation and the bypass system invert elevation. The pump will not be active while levels in the pond are above the bypass invert.

### 3.2.1 Minor and Major System Conveyance

The design of the site storm sewer system, as well as major system grading has been provided in the FSR prepared by Dillon Consulting Limited on April 2022. For the purpose of the stormwater management pond design, major and minor system runoff from contributing areas are assumed to be conveyed unimpeded to this facility.

### 3.2.2 Stormwater Quantity Control

The proposed SWM infrastructure is sized to control post-development flows to the allowable release rate for all events up to and including the 1:100 year design storm events. From Section 2.3, the allowable release rate is estimated as  $0.102 \text{ m}^3/\text{s}$ . A pump with the required capacity to control the site flow lower than the allowable release rate is proposed from the pond to the outfall.

To assess the resiliency of the proposed SWM facility, an additional modelling scenario was performed using the Urban Stress Test (UST) design storm event provided in the Windsor/Essex Region Stormwater Management Standards Manual (December, 2018).

A minimum 0.3 m freeboard is required above the 1:100 year storm event (Section 3.3.2.3, ERCA SWM Standards, 2018). From the modelling analysis, a freeboard of 0.36 m is estimated for the 1:100 year 4 hour event, 0.62 m in the 1:100 year 24 hour event, and 0.16 m in the UST event. Based on the proposed conditions modelling analysis for the required design storm events, the proposed pond will store the volumes shown in Table 5 in order to meet the required release rates.

Table 5: Required Storage Volume and Pond Free-board in Different Storm Events

Storm Event	Required Pond Storage ( $\text{m}^3$ )	Available Pond Freeboard (m)
1:100 Year, 4 hour	6,585	0.36
1:100 Year, 24 hour	5,335	0.62
UST	7,620	0.16

To accommodate the UST event, the total volume below the top of bank will need to store 7,620 m<sup>3</sup> as a minimum. As mentioned in Section 3.0, the proposed stormwater management pond will consist of 3:1 side slopes in the active storage area, and allow for 2.0 m of active storage depth. The total active pond volume available is 8,542 m<sup>3</sup>, which is adequate to store all storm up to and including the UST event.

Table 6 below shows the comparison of inflow from the Morgan Drain sub-catchment and outflow from the bypass pipes. Twin 1.092m by 1.727m horizontal elliptical pipes have been proposed as the bypass system.

Table 6: Comparison of Morgan Drain Sub-catchment and Conduit Flow

Storm Event	Bypass Pipes Outflow (m <sup>3</sup> /s)	Morgan Drain Subcatchment External Inflow (m <sup>3</sup> /s)
1:5 Year, 4 hour	0.62	1.00
1:100 Year, 4 hour	1.56	2.12
UST	2.16	2.37
Water Quality Storm	0.22	0.50

Note that while the pond outlet flow rate does not exceed the inflow rate from the Morgan Drain external areas, it is implicit that the site allowable release rate is met.

### 3.2.3 Water Quality Control

The proposed SWM facility services a catchment area of approximately 5.3 ha and the external drainage area for the Morgan Drain of 25.42 ha. As discussed in Section 1.2.3, the facility will be designed to provide a Normal Protection Level water quality treatment (70% TSS removal) for the 5.3 ha development only. Due to the pond orientation, the required length of the forebay, as governed by settling distance, is not achievable when the pumped outflow is set to the allowable release rate. In order to lower the required settling length to an achievable distance, the pump outflow rate is proposed to be 0.30 m<sup>3</sup>/s.

Based on the 2003 MOE guidelines, the following parameters must be met to achieve the water quality control requirements:

- Minimum permanent pool volume of 420 m<sup>3</sup>; and
- Minimum forebay length of 22 m (governed by settling distance).

The total permanent pool provided in the proposed pond is approximately 680 m<sup>3</sup>, and the approximate length available for the forebay is 22 m. A riprap apron is also proposed for energy dissipation at the pond inlet to reduce the velocity of incoming flows. A rip rap apron has been sized following the specifications of HEC 14, 2006 and HDDS, MTO, 2008 standards. For a 1:5 year event flow rate of 1.68 m<sup>3</sup>/s, and an inlet of 1.2 m in diameter, the nominal stone size has been estimated as 100 mm with an the apron length of 4.8 m. Although the estimated stone size required is relatively small, a rip rap

distribution of R-50 has been specified as per OPSS 1004. The details of the water quality calculations are provided in Appendix D.

Note that the permanent pool volume has been specified to treat runoff from the proposed site only, and not the external Morgan Drain contributing areas.

4.0

## Conclusions

The stormwater management design for the proposed development meets the established SWM criteria for the overall site, and negative impacts due to the site development are not anticipated for the receiving system.

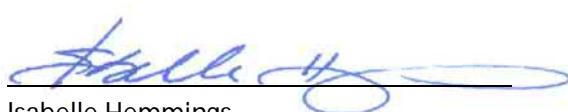

The conclusions are based on the results of the stormwater management analysis as follows:

- The proposed development will have a maximum allowable release rate of 0.102 m<sup>3</sup>/s into Morgan Drain. This allowable release rate will be controlled using a pump, and by providing an active storage volume of 8,542 m<sup>3</sup>.
- The proposed pond provides a minimum 0.3 m freeboard for the 1:100 year event.
- The proposed development will capture the UST event without spilling overland from the site.
- Water quality control of the SWM pond for 70% TSS removal will be achieved by providing a permanent pool volume of 680 m<sup>3</sup>. The pond provides a 22 m long forebay, as required.
- To obtain the required forebay length, the pump flow rate is proposed to be lower than the allowable release rate for the site. The proposed pump has maximum outflow rate of 0.03 m<sup>3</sup>/s which aligns with both the water quantity and water quality requirements.
- An 4.8 m long energy dissipation apron has also been recommended at the pond inlet using rip rap sized to meet R-50 gradation as described in OPSS 1004.

This report is respectfully submitted for review and approval. Please contact the undersigned should you have questions or require additional information.

### *Water Quality Calculations*

Tri-M Holdings Corp.  
440 Texas Road - Stormwater Management  
Report  
October 2022 – 22-4361

 <b>DILLON</b> CONSULTING	Stormwater Management Calculations	Project:	440 Texas Road - Detailed Engineering	No.:	224361
	Water Quality Calculations	By:	MS	Date:	2022-10-12
		Checked:	JVM	Scenario:	Proposed

SWMF - Water Quality Requirements	
Drainage Area	5.30 ha
<b>Q<sub>p</sub>=0.0011m<sup>3</sup>/s/ha</b>	
% Impervious:	62.00
<b>Normal 70% TSS Removal</b>	
Treatment Volume	119.33 m <sup>3</sup> /ha
Active Storage:	40 m <sup>3</sup> /ha <b>212</b> m <sup>3</sup>
Perm Storage:	79.33 m <sup>3</sup> /ha required <b>420</b> m <sup>3</sup>
Extended Detention Outlet	2.5 L/s average <b>6</b> L/s max (2.4 x avg)
Erosion Control (14 L/s/ha for 5yr storm)	74 L/s
Erosion Control (8 L/s/ha for 5yr storm)	42 L/s

Notes:

Input

Output

SWMF - Required Forebay Length	
Length to width ratio of forebay, <i>r</i> =	5.0:1
<b>Peak outflow (32 mm WQ storm), Q<sub>p</sub> =</b>	0.030 m <sup>3</sup> /s (24hr ext. det)
Target particle size =	150 mm
Settling velocity, V <sub>s</sub> =	0.0003 m/s
<b>Forebay Settling Length, Dist 1</b>	
$Dist_1 = \sqrt{\frac{rQ_p}{V_s}}$	<b>22</b> m
<b>Forebay Dispersion Length, Dist 2</b>	
Desired velocity in forebay, V <sub>f</sub> =	0.5 m/s
<b>Peak inlet flowrate , Q<sub>p</sub> (32 mm WQ storm)</b> =	1.285 m <sup>3</sup> /s
Depth in forebay, <i>d</i> =	1.0 m
$Dist_2 = \frac{8Q_p}{dV_f}$	
	<b>20.56</b> m
Therefore, the settling length of 22 m governs the design.	
<b>Required Length:</b>	<b>22</b> m
